Python Programming — Questions

1. Write a Python program that takes the user's name as input and prints a greeting message in the format: Hello .

2. Write a Python program to accept two integer values from the user and display their sum.

3. Write a Python program to accept two integer values from the user and display their difference (a – b).

4. Write a Python program to accept two integer values from the user and display their product.

5. Write a Python program to accept two numbers and the desired decimal places from the user. Display the division result rounded to the specified decimal places. Handle division by zero with an appropriate message.

6. Write a Python program to accept two integers a and b, display their values before swapping, swap them, and display the values after swapping.

7. Write a Python program to accept an integer n and determine whether it is Even or Odd.

8. Write a Python program to accept an integer n and determine whether it is Positive, Negative, or Zero.

9. Write a Python program to accept an integer (possibly negative) and print its reverse. The sign must be preserved.

10. Write a Python program that accepts an integer and prints the total number of digits in it (ignoring the negative sign, if any).

11. Write a Python program to accept a value n and print numbers from 1 to n in a column-wise tabular format with 10 columns, where each column increments by 10.

12. Write a Python program to accept a value n and print multiplication tables from 1 to n side by side in column format (rows represent multipliers 1–10, columns represent tables 1–n).

13. Write a Python program to accept a positive integer n and compute the sum of all integers from 1 to n using a loop.

14. Write a Python program to accept an integer n and compute its factorial. If n is negative, print an appropriate error message.

15. Write a Python program to accept a number n and print the first n terms of the Fibonacci series, starting from 0.

16. Write a Python program to accept a number as a string and determine whether it is a Palindrome or Not Palindrome.

17. Write a Python program to accept a positive integer n and check whether it is a Prime or Not Prime number. Use an efficient approach (check divisors up to $\sqrt{n}$).

18. Write a Python program to accept an integer n and print all prime numbers from 2 to n.

19. Write a Python program to accept a base number and a power value, then display the result of raising the base to the given power.

20. Write a Python program to accept a string from the user and print its reverse.

21. Write a Python program to accept a string and count the total number of vowels (a, e, i, o, u) in it, ignoring case.

22. Write a Python program to accept a string and count only the alphabetic characters, excluding spaces and special characters.

23. Write a Python program to accept a string and display it entirely in uppercase.

24. Write a Python program to accept a string and display it entirely in lowercase.

25. Write a Python program to accept a string and determine whether it is a Palindrome or Not Palindrome.

26. Write a Python program to accept a sentence from the user and print the total number of words in it.

27. Write a Python program to accept a string and print it with all spaces removed.

28. Write a Python program to accept a string and display its total length including spaces.

29. Write a Python program to accept a string and print it with only the first character capitalized.

30. Write a Python program to accept a string and print its characters sorted in ascending order.

31. Write a Python program to accept a sentence, split it into words, sort them alphabetically, and print the sorted list.

32. Write a Python program to accept a list of integers (space-separated) and print the largest element.

33. Write a Python program to accept a list of integers (space-separated) and print the smallest element.

34. Write a Python program to accept n key-value pairs from the user and store them in a dictionary. Print the resulting dictionary.

35. Given a pre-defined student dictionary with keys 'name', 'age', and 'city', write a Python program to accept a key from the user and print its value, or 'Key Not Found' if the key doesn't exist.

36. Write a Python program to accept a list of integers (space-separated), remove all duplicate values while preserving the original order, and print the result.

37. Write a Python program to accept a year and determine whether it is a Leap Year or Not Leap Year using the standard leap year rules.

38. Write a Python program to accept an integer and check whether it is an Armstrong Number. (An Armstrong number equals the sum of its digits each raised to the power of the number of digits. Example: $153 = 1^3 + 5^3 + 3^3$)

39. Write a Python program to accept a temperature in Celsius and convert it to Fahrenheit using the formula: $F = (C \times 9/5) + 32$.

40. Write a Python program to accept three integers a, b, and c, and print the greatest among them.

41. Write a Python program to accept the radius of a circle and compute its area using the formula: $Area = 3.14 \times r^2$.

42. Write a Python program to accept principal (p), rate (r), and time (t), and compute Simple Interest using the formula: $SI = (p \times r \times t) / 100$.

43. Write a Python program to accept a single character from the user and print its ASCII value.

44. Write a Python program to accept a string and print it after removing all vowels (a, e, i, o, u), ignoring case.

45. Write a Python program to accept two lists of integers (space-separated), find their common elements, and print the result.

46. Write a Python program to accept three integers and compute their average.

47. Write a Python program to accept a last number n and a power value, then print a table showing each number from 1 to n raised to the given power.

48. Write a Python program to accept a person's age and check whether they are Eligible for Voting (age >= 18) or Not Eligible for Voting.

49. Write a Python program to accept a distance in meters and convert it to kilometers.
